

Exploring How Augmented Reality (AR) Glasses Will Influence Ourselves and Our Social Interactions

Background

Augmented Reality (AR) technology is on the brink of becoming a reality in our daily lives. Until today, most research regarding AR was aimed at determining how AR technology itself can be enhanced and how socially acceptable it is to wear such a device. In my research, I want to go a step further and determine how potential applications of AR might influence us as social beings and our interactions with one another. Doing so before this technology becomes a daily reality can help avoid mistakes that could negatively impact our society.

Research Goal

The goals of theses in this area cover identifying potential future applications of AR devices in a social context. Including the analysis of existing research, specification of new concepts, their implementation, and evaluation. Based on the graduate level (Bachelor, Master) and interest, the scope of the thesis is adopted.
