

Live Life
and Understand it.

COMMUNICATION

Meaningful & vital

zoe
SUCCESS FACTORY

■ FOREWORD – COMMUNICATION

■ MISSION LIFE Life, understand yourself, live quality.

▲ **Our universe, existence, everything around us we call nature. Change is the basic operation of nature.** Everything we can see and grasp is subject to constant change. Some change is directly perceptible (wind, warmth, sounds, light). Other change can only be perceived due to the differentiation of before and after, i.e. by referring to the previous state in memory. Such changes take place slower for us, e.g. the celestial bodies move (resulting in day and night). Change is thus the basis of our existence and ability to act. Without change there would be no possibility of interaction, perception or life.

■ **The discovery of BCOL** by Professor Johannes Keller (University of Ulm) in one of the most extensive research programs concerning human understanding (cognition), the process of how life, thinking, understanding, man and nature are interrelated, could now be fully explained in a logic BCOL "balanced cooperative operative logic". Thereby a new self-understanding emerged.

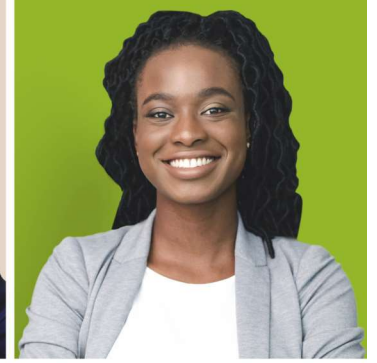

■ **This new self-understanding** opens up a whole

new basis and understanding for us humans about how things work and the exact meaning of communication, among other things.

● **Read now** and learn why and how this is important for you personally, as well as on what basis you can put your life on a higher quality level. You will learn why there have been so many unanswered questions in the world so far and that there are answers for them now. You will learn how exactly communication works, the logic of it and accordingly you will be able to move completely consciously on a whole new qualitative level of communication in the future.

After reading this, you will be able to look at your life and the lives of all people with completely different eyes and see possibilities that will allow you and all other people to have a completely different new quality of life and livelihood.

➤ **MISSION LIFE – benefit from the full range of one's life, through one's own unfolding as well as that of all other life.**

■ Communication – the language of nature

■ Communication – The foundation of autonomous life

Communication is an ingenious means, on the basis of which autonomous organisms can agree with each other, give each other ideas and possibilities. Correct communication is the organization of social togetherness, a win-win for all autonomous organisms. Through proper communication, understanding can be implemented, making action more efficient and creating a common idea that each organism can develop individually for itself.

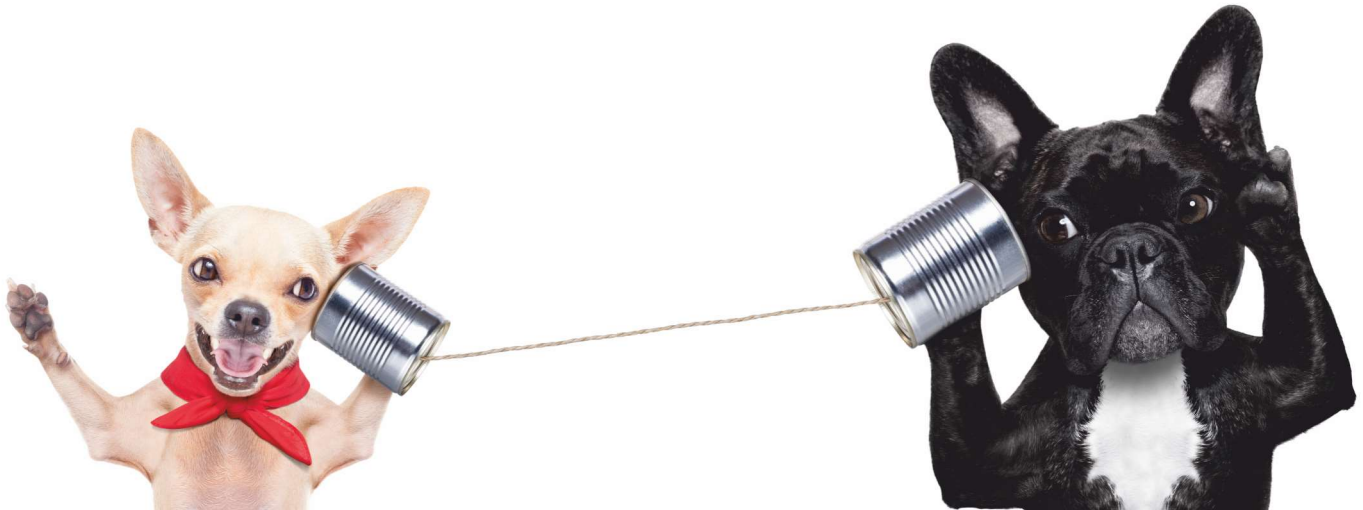

■ Communication – more important than thought

The following is a review of the basics of communication and a complete understanding of what com-

munication is and how it works. This needs to be elaborated further because it is one of the most important and efficient means by which autonomous life can communicate with each other.

■ Communication – a necessity of life

Autonomous life is actually not possible without communication. This is sufficiently known from researches, however, many of us are not really aware of it. Still in the 1960s perfidious examinations were made on babies, these were supplied with all vital things, however, were not spoken with them or otherwise given up with them. These babies died. Today we know that communication is vital for various processes and what and how it works.

■ Communication – the effect

■ Communication – the ways and methods

Today, there are many different means and methods of communication. However, what actually stands behind communication, what it does, could only be described precisely on the basis of the BCOL as well as the Blueprint logic.

■ Communication – the awareness of the effect

This results in a whole new understanding of communication, its importance and its effect. Without this understanding, it is impossible to communicate correctly without causing something that you did not want to cause.

■ Communication is based on natural laws

In order to understand this and then to be able to qualitatively give myself as well as others a completely different level of communication and experience, it is necessary to have understood the nature-given basics. These open a new understanding and with it completely new possibilities and future ways of thinking.

■ Nature, Interactions & Interdependence

Nature, its communication – the basis to understand the power of communication.

Everything we perceive in our habitat, in nature, is based on physical change that follows a simple yet highly efficient logic, mechanics or method. Since the manifestation of this natural mechanics as "BCOL" we are able to understand this and by logical application everything that happens around us, to comprehend with it and to develop new understanding coherent methods.

■ Our brain is trained by us

We can also communicate this logic to our brain, train it with it, so that our subconscious will apply it automatically and thus we can exercise (social) interactions many times more efficiently and correctly according to nature, but more about that later.

1. Nature & Communication

the physical part
of communication

■ Communication – the mode of action, function

■ BCOL – this is how everything works

BCOL means "balanced cooperative operational logic" – all processes, which nature executes, are based on this logical operation or can be explained by this logic. The logic is 1:1 identical with the processes in nature, nature executes it, thereby changes situations, its appearance.

■ Perception builds our brain

The same logic – based on what is perceived – is used by our brain. That means, our brain, whose actual function is to think, is based on the fact that our brain perceives the processes taking place in nature through the sense organs, converts the impulses, the nerve cells form and network physiologically accordingly.

■ Our brain – a "logic recorder"

This creates a kind of logical recorder that develops the ability to behave autonomously in nature. If a logic is then triggered by perception, the corresponding strand recorded via the recorder (i.e. mapped in the nerve cells) becomes active and runs. We call this intuition, which is simply triggered automatically in our brain without us having to think in consciousness and runs physically (intuitions are learnable and described in the chapter "Intuition").

■ Communication – life is interaction, communication, change

■ If everything works like this, then so do we

BCOL also concerns our body communication, also called body language, because BCOL means everything in nature is in motion, in change (light, heat, etc.).

■ Change – the basis of life

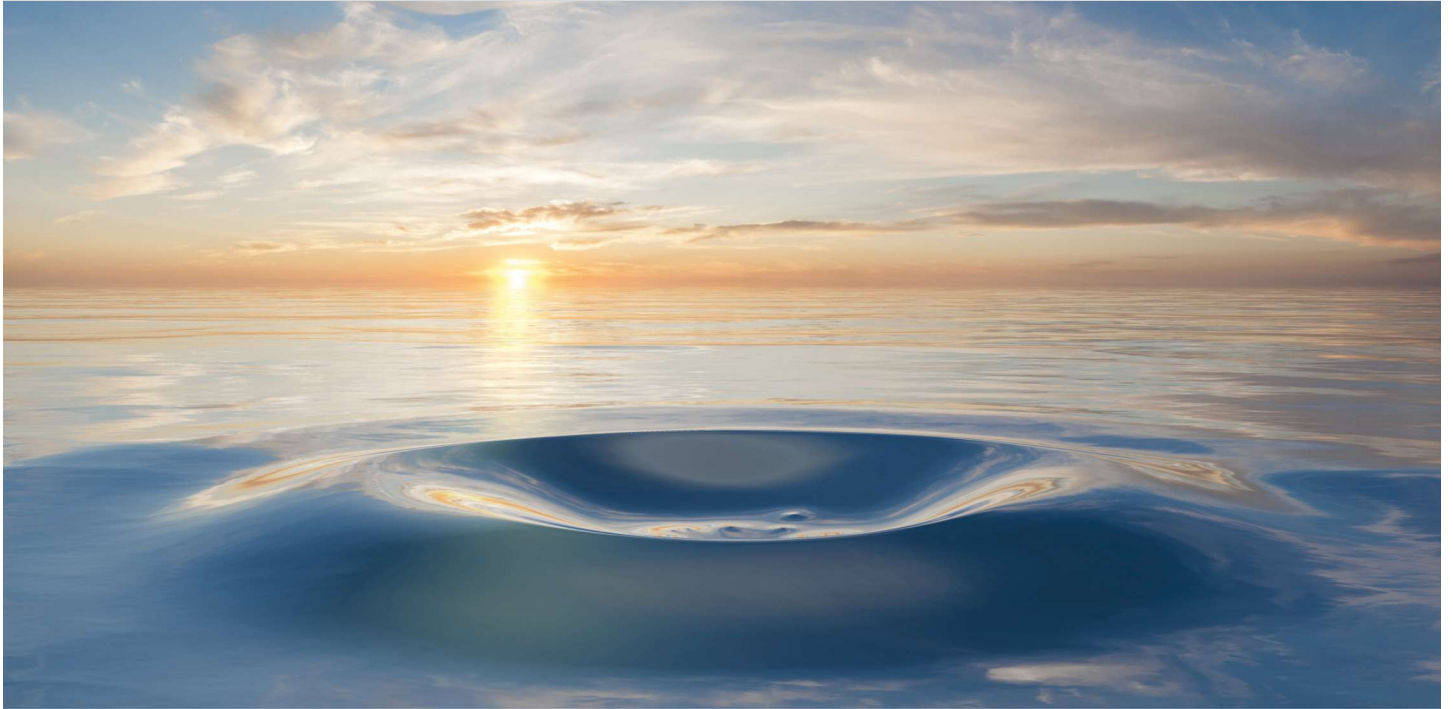

Everything is change and vibration, even matter is constantly changing, it vibrates differently depending on what temperature it has, the surface is triggered by light and reflects this.

● Interactions – the regularity

That means everything is interactions, every object is "cooperative" with every other in interaction.

■ No exceptions

To explain: Imagine an object that you grasp with your hands and it would not let itself be grasped, that is, it would not interact "cooperatively" with your hand, your fingers. Then you would simply be able to reach through it as if it were a ghost. There is no such thing. In nature, in existence, everything is "cooperative", that's why we can stay on the earth, otherwise we would fall through the earth.

■ Communication – life is in relation to nature and other life

■ Imagination, the logic, the comprehension

Now imagine a pen floating in the air, which they grasp. It behaves cooperatively because it can be grasped, but it cannot be moved a millimeter. It remains exactly in the same position in the air. This is also not possible in nature. The pen will behave cooperatively as well as balanced, i.e. its object properties will be balanced to the other object.

■ Balancing – the ratios to each other

This is expressed, for example, by its weight, the interactions between it and the earth. If we overcome this balanced cooperative interaction with the earth by the force of our hand, we can cooperatively put the pencil to another place. This means BCOL describes the interactions in nature in a logical form, valid for all processes and objects equally.

This logic has now also been implemented in technology, which has thus been given the ability to reason (infer, etc.).

● Balancing – the law of time

Balancing means, an object always interacts "balanced" with its environment, there is always a balance of vibration, movement, energy.

■ No exceptions

To explain, imagine a cup that you grab with your hands and it would not lift, no matter how strong they are. So not "balanced" interact with your hand, your fingers. Then you could not move objects, nothing would change. There is no such thing. In nature, in existence, everything is "balanced", that's why we can live and change.

■ Communication – the mechanics behind it

■ This is how the brain works

But now back to the actual question: what does this mean for communication? Our brain – we have seen – adapts these processes (like lifting a pen) through physiological, physical processes, by physically forming nerve cells that establish connections through the perceived signals, activate other nerve cells, so that our actuators actively communicate with the environment. So actually this is not communication, but interaction, like when we do something directly with an object like the pen.

■ Interaction = Communication

In fact, there is no serious difference between communication and interaction. The purpose and also the function is logically the same. Communication,

like interaction, always serves to change the environment as desired. Our brain processes this equally with the same logic (blueprint logic). It is based on BCOL, only instead of executing it, it stores, it remembers the communication, interaction, not the content but the logic. (Read the chapter "The human being").

■ Our brain – the communication center

With this, the brain can be seen as a communication and command center, either it communicates with our actuators and sensors like hands, feet, eyes or with our consciousness and gives us back the perception we would like to have, or simply lets the actuators communicate or interact.

■ Communication – Understanding interaction

■ Direct vs. indirect interaction

We interact directly with the pen or a cup, without any mediation. This means that the object is directly within our reachable radius. In fact, however, a communication arises nevertheless, because during the grasping our hand has displaced air, shifted thus not only with the object interacts, but also with many other objects, these with the next etc.. This is also called interactions. BCOL explains this exactly. Accordingly, every interaction also causes communication, indirect interaction. Even if we tiptoe and sneak up, some sounds or a breeze we will still cause.

■ Indirect interaction – the quality

Incidentally, we are completely dependent on this indirect communication in our living space, because light, sounds, electromagnetic waves, etc. are examples of this indirect communication or interaction. The interactions that light triggers in our

eyes is what enables us to see an object in the first place. The object communicates or interacts with us even before we grasp it. All solid objects known to us are characterized by the fact that they interact with light, i.e. they absorb it and transform it into heat and always reflect only a part of it. Even glass absorbs heat and reflects it, only a part comes out on the other side as light. Communication, or indirect interaction is vital for us, it is the energy of life.

■ Indirect interaction – our life energy

Indirect interaction causes interaction, all interaction that creates change, i.e. is not in balance with everything else, we perceive as energy. The energy, the interaction, that we receive through indirect interaction is the energy that we can then use in direct interaction to shape the environment according to our wishes.

■ Communication – understanding nature, life & interaction

■ The light – a medium of communication

Light is actually one of the most important indirect means of communication for us. For example, the sun with its light has only made it possible that life could use this for living, i.e. to draw the "energy" for living and acting from it. Because this interaction is indirect, but contains so much energy that plants use it, we have enough warmth and can also still see.

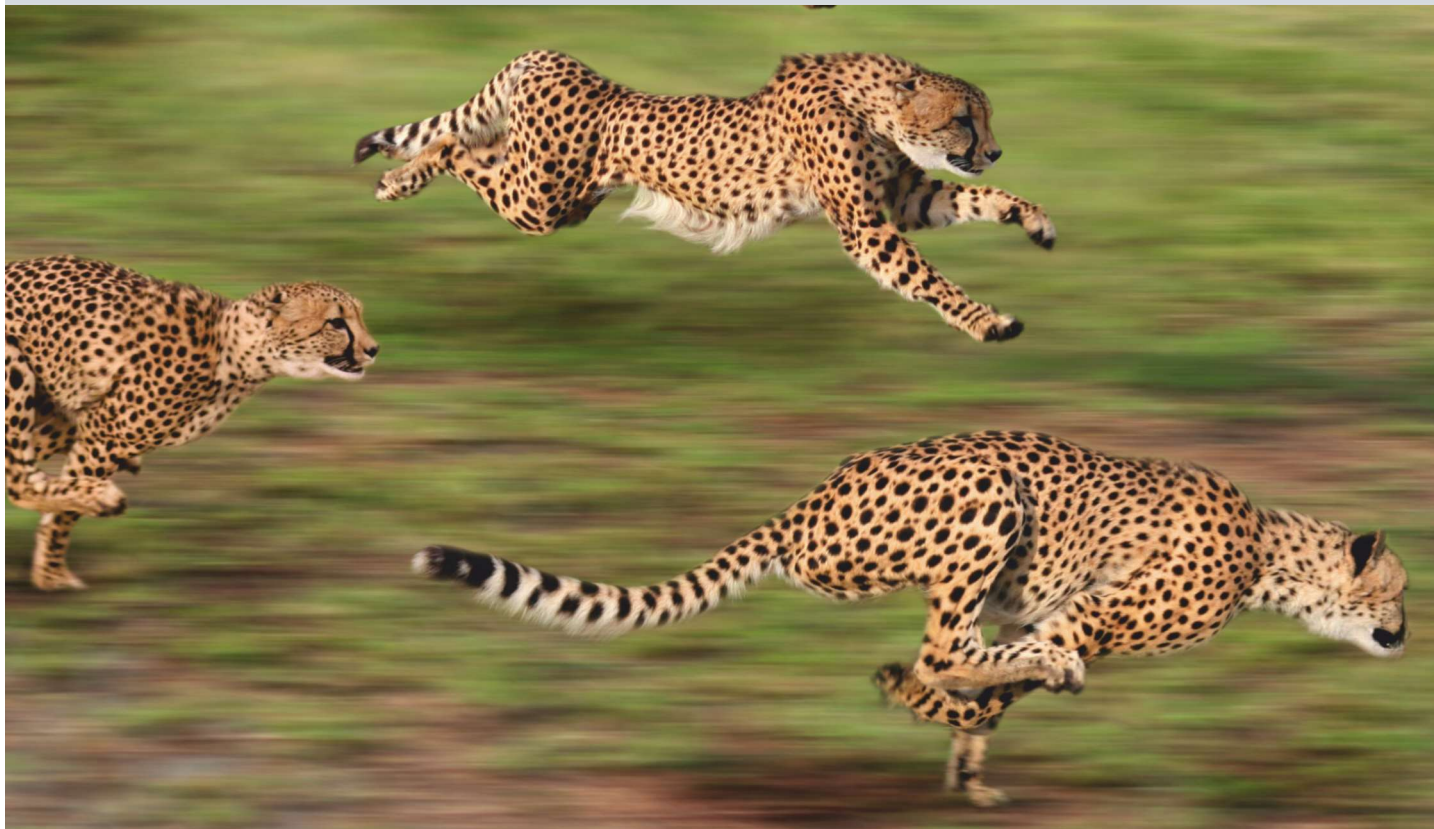

■ Sound – a way of communication

Sounds also communicate, e.g. a fly or a stone hitting us or when something falls down. We then quickly flinch away. So this indirect communication is not only mastered by organisms, but also by inanimate objects, because they are always in

interaction with others. However, we no longer perceive the "background noise" of this, because this is normal for us; our brain only perceives deviations. Sounds or noises are thus the temporal reproduction of an occurrence, thus interactions, of larger objects in the direct togetherness. The communication is thus the indirect interaction according to the BCOL the balanced cooperative effect overtime.

■ Existence is communication & interaction

Thus, communication or also interaction, the interactions, is the prerequisite for life and habitat to exist at all. Nature could not exist without indirect interaction or communication. This describes the BCOL.

■ **Communication – interaction with nature & communication with life**

■ **Life – the possibility to change communication & interaction**

Over long time static objects have thereby the property of an apparently always constant communication or interaction on the basis of their balanced relationship to other objects. So a stone is apparently static, but also it changes, even if it remains the same at least in its properties for us humans for a long time.

■ **Power of life**

In contrast, living organisms have the possibility to change their interactions. It is possible for every life to gain energy from it by using the indirect interaction, the communication, as well as the

direct interaction (use of the temporal shifts) and to change itself with it. This is biological life.

■ **Life – actively using nature**

Autonomous organisms have the additional possibility to use nature directly in the habitat through the communication of their sensors (eyes, sense of touch, etc.) and actuators (feet, fins, hands, etc.) and to search for what is needed independent of location. I.e. interaction is called direct "communication" with nature. Communication is the means to exchange with other life through interpretation of communicative interaction or to agree on further common actions.

2. Life & Communication

Understanding communication

■ Communication – understanding the processes in the brain

■ Intuitive interactions

Depending on the situation, different interactions, i.e. actions, are necessary for communication. This requires a control center, which on the one hand can identify the situation, on the other hand can trigger the now successful action. In animals and humans, the brain is responsible for this, which forms itself according to this logic exactly in order to be able to control the sensors, their perception, like the actuators. The actions originating from this ability we call intuitions.

■ Intuitions – the "learning" of our brain

The memory or the logic (blueprint logic) that the brain builds up by changing itself on the basis of perception enables autonomous beings to get a virtual idea of the environment and nature. This is necessary to be able to learn and get understanding of themselves, their possibilities as well as the envi-

ronment. The brain becomes better and more efficiently trained, i.e. it can determine if an interaction was unsuccessful and use a different strategy the next time to influence the situation through its own interaction in such a way that it comes to success.

■ The consciousness – understanding what is learned

The consciousness has no influence on the individual sequences, it only logically concatenates the existing intuitions to an entire sequence. That means, virtually we can bring ourselves in the consciousness the individual intuitions, experience about nature, or how we handle our actuators etc. into an order, i.e. a sequence. If we then instruct our brain our subconscious "this is what I want", it will execute this.

■ Communication – the basis of agreement, togetherness, understanding

■ The consciousness, the order, the understanding

If we have put the sequence of our interactions together correctly, we will get the presented result. The order and type of actions make up the result. We can then give up if it didn't work, or try again in a different order until it does. Or we realize, the idea we had, does not allow the nature, their interactions at all.

■ Everything is just communication & interaction

Every autonomous life depends on communication with the environment as well as with itself. The consciousness communicates with the subconsciousness, i.e. the brain, this with sensors, these with the objects, the brain communicates via nerves with the actuators, these again with nature by interaction. The brain thereby logically coordinates actuators, sensors and objects, logically translates the image into interaction of the actuators. Thus a multiple indirect multilingual communication system.

■ Communication – the different methods

■ Disruption of communication is restriction

If communication is disturbed or fails, life can no longer live, body language is no longer there, interaction is no longer possible. Accordingly, disturbed communication is the preliminary stage of the disability of life. The more disturbed, the less life is able to live out its possibilities in its actual nature and environment. Piece by piece becomes impossible, shuts down, until at some point life is no longer possible.

■ Intercommunication between different living beings

Animals observe body language, listen to the sounds of their conspecifics or even other animals, know from this already how they will behave, in packs they align themselves or divide tasks. Each according to the most promising concept.

■ Double indirect interaction

In order to be able to use also with organisms of the communication, which are not in the field of vision, autonomous beings have developed also sounds (tones). The brain has assigned different situations to the tones again, by the fact that it has put again physical connections between nerve cells by the perception of these tones, which trigger a certain logic as soon as such a tone comes, in order to be able to interact immediately. This is a 2-fold indirect interaction: on the one hand tones are already indirect, i.e. they are transmitted over distance over another medium like e.g. the air. On the other hand the change of the tones is thereby the instruction, the content, from which the receiver can take again its own interaction.

■ Communication – Indirect Virtual Interpretable Communication

■ The identification determines the following interaction

The recognition of such sounds or "words" takes over the brain. However, if the sounds have been perceived and the situation does not fit to it, because the communication partner performs a deception or makes a joke, the brain will disconnect the sound, the word from the situation due to this experience and will no longer react following the original logic of action, the words lose their value.

■ Life organization

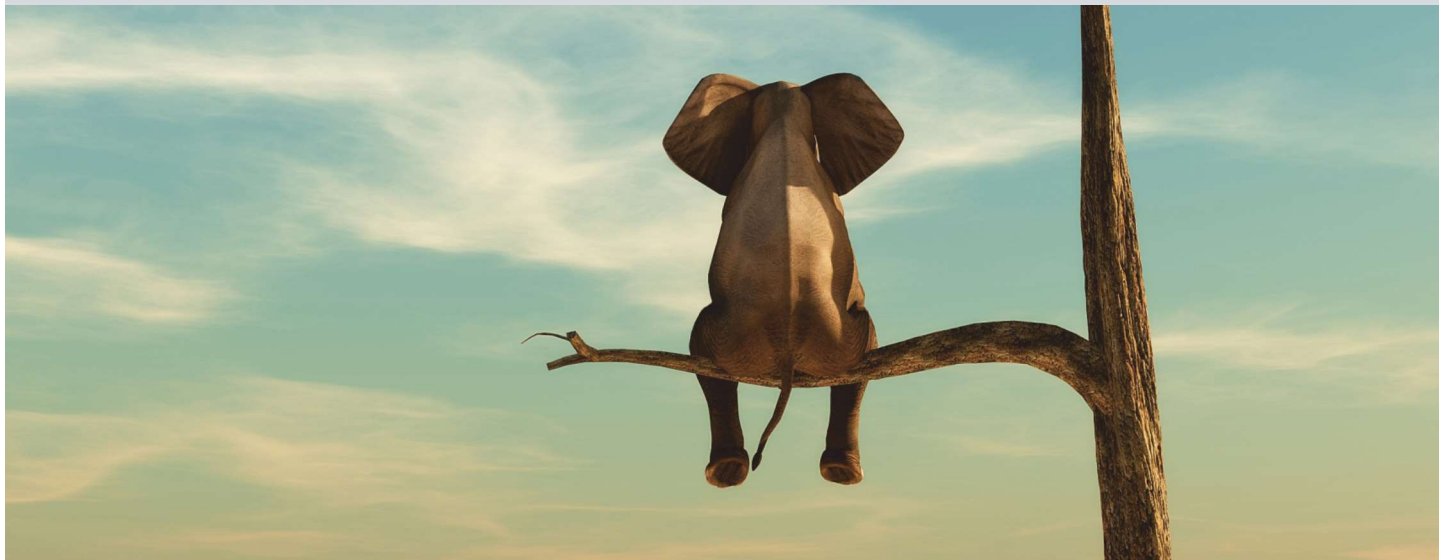

Communication is accordingly the interaction with other autonomous organisms, in order to be able to agree on the situation, the own action as well as expected actions, in order to come socially, together with the other one to a result or to make the communication partner attentive to something, which this did not notice, in order to release another action, which will be successful. Communication is thus the means of organization for life and condition for a togetherness.

■ Communication triggers interaction

Communication therefore always triggers a logical interaction (action) in the brain, according to what is stored behind the words. If words are used indiscriminately, the most diverse ideas arise and people are then no longer compatible in understanding and action.

■ To think about – what do we do

It is significant at this point that a quantitative increase in the number of words used can be observed: the German vocabulary is constantly expanding; while it was just over 5 million words until 1957, it is now over 23 million words. Of course, this includes technical terms. But the common vocabulary has also increased, it is estimated today at 500,000 words. Depending on education, the vocabulary of an adult is estimated at 200 to 300 thousand words.

■ Communication – Virtual identification and interpretation, the failure

■ Another identification, another sense

A word corresponds to a meaning, i.e. stands for an interaction or description of something. In recent years, many words have acquired multiple meanings. E.g. with "write": in former times one assumed that it would be production of a handwritten text, today this can be a computer document, handwritten, or in a chat, etc.. I.e. the meaning has been interpreted several times in the meantime and the definitive action can no longer be taken from it. From it chaos arises automatically, everyone does what he "thinks" so as he identified that. For everyone his identification is also the right one. How should he know that the other has a different identification? The words were the same.

■ New words, new identifications, new meaning

On the other hand, a lot of new words have been created or the meaning of words changes completely, e.g. "I'm meeting with... today". In the past,

the meaning would have been, you meet at a specific place. Today, in the majority of cases, it means an online meeting via a medium. A large part of the vocabulary has become group-specific, i.e. the vocabulary has a certain meaning in this group and would lead to misunderstandings in another group. The interpretation, that is, the meaning of a word is not the word itself, but the content – that is, what another would do with the word or understand by it.

■ The words equal, the misunderstandings great

Overall, this has now become a serious problem in communication. People are only able to communicate with each other in ever smaller areas. On the one hand, the differences in knowledge are becoming more and more serious, and on the other hand, depending on the knowledge and group membership, the meaning of the words and the interaction that is meant by them changes.

■ Communication – More identifications lead to even more misunderstandings

■ More will make it worse.

The number of words is increasing partly because there is currently a focus on specific moments or situations that are named with ever new words (e.g., everyday racism, contagion chain, dystopia, hate speech, influencers, upload filters, etc.). In doing so, the understanding of the processes and interactions behind the terms usually remains unnoticed or unknown. The anchoring of the terms in real reality thus remains unclear in many cases, with the consequence that the ever-growing vocabulary is associated with increasing confusion and uncertainty among people.

■ The sense, identification of the content

A word is fundamentally used for the purpose of describing something, describing a process, identifying something, quantifying something or concatenating, differentiating something. Accordingly, it is necessary that both the sender and the receiver each interpret the word as the context in the same way, otherwise misunderstanding and failure in communication will take place. Conclusion: every word is a command and automatically triggers an interaction in the receiver, it should, that is the purpose of communication. Condition is just that it is identified also by every receiver the same, that an identical interaction is stored to the word, in order to avoid misunderstandings.

3. Life & Quality

Communication

as the basis for life & survival

■ Communication – WWTH (KHEO), the basic understanding, the quality of interaction

■ Knowledge, meaning, interaction – the explanation

With knowledge two different kinds of knowledge can be meant. Knowledge can be either the knowledge about a process or the knowledge about a situation or a moment. Both are seriously different. The knowledge about a situation means only to be able to express the existence of something, e.g. "There are cars". The knowledge about a process means, the knowledge about a process, thus knowledge about temporal change. This means that I can have the knowledge about the existence of a spaceship, but without knowing how it works. Since there are considerably more functioning devices today compared to earlier times, the distinction of the knowledge is seriously necessary, otherwise misunderstandings arise.

● 1. Knowledge

So there's the isolated "knowledge," that's just the word spaceship, I know that exists.

● 2. Knowing How

The "knowing how" includes, I know, that a spa-

ceship lifts off via a propulsion system and flies into space.

● 3. Execute

The "knowing how to do" includes, I know how to pilot a spacecraft, what it takes to do that, how that works, and can visualize how to do that.

● 4. Interaction (Operation)

The "acting", the operation includes, I have proved my understanding, because I have flown with a spaceship, because I have steered it, because I have then landed again, that I not only have the "knowledge", not only the "knowledge how" and not only the "knowledge how to do", but that I can actually handle a spaceship, i.e. act with it.

▲ **WWTH (KHEO) – is a basic understanding**, which expresses actual understanding of a process, but not understanding of its temporal and parallel impact. So there is a difference between the understanding of a process and the understanding of the quality of the interaction, i.e. the impact of the process.

■ Communication – IEOF the basic understanding, complete quality, quality of life

■ The quality is understanding

This distinction of the meaning of the word "knowledge" was hardly made in the past. We could not express this either, because in the past it was clear that we only do what we have learned. Thus it was clear that only a plumber has the knowledge about plumbing, only an electrician has the knowledge about electronics.

■ Definition of understanding

Comprehensive understanding is a qualitative process with consideration of the effect(s) of interaction:

● 1. Integrity

Integrated understanding: Condition is always that I do not harm my life, as well as other life and the action of the nature is conform, i.e. the nature no damage causes. This also over time. Then this is an integrated action, in the life, in the habitat, with it qualitatively high-quality. I.e. I have not acted outside of the natural operation, all necessary life cycles remain intact, with me like other humans and in nature.

● 2. Economy

If the results are such that I can continue to use

them in the next situation, i.e. they allow me as well as all other life to continue to live in the future, I have understood and taken into account the cycle of nature, economy.

● 3. Functionality

Functional understanding: Only when I can act on something in a way that produces the expected result, I have understood the function of the interaction.

● 4. Organization

Organizational Understanding: Since we now know that each of our interactions affects and changes our environment, the importance of organization is high. This means that it is necessary to take into account that all other lives can do something with my results and that they are informed about them. This is called organizational understanding, it is the basis of living together.

▲ IEOF is the comprehensive understanding of life, the environment, the habitat, the future. It indicates the quality of interaction, as well as the impact over time and for other life. IEOF makes the organization of life possible.

■ Communication – the limits of interpretable communication

■ The problem of understanding

Understanding changes because computers and software take over the networking of tasks that used to be assigned to specialist areas and are now often combined in software. This makes it possible to launch a rocket and steer it into space, although I myself do not have the "knowledge", the "knowledge how" and the "knowledge how to do", but rely on the computer to do correctly what it indicates to me and thus fly the spaceship into space. Whether in reality this is actually carried out in such a way or the computer does completely different things than I think, is not visible thereby any longer. If now errors occur or I speak with an actual space expert, who steered a rocket, the understanding of us both can be completely different. With errors I will not look for the errors at the rocket, because I

myself cannot reconcile the "knowledge", the "knowledge how" and the "knowledge how to do" with the rocket at all.

■ The denominator of the individual understanding

Since we know that understanding is due to the differentiation of processes and procedures whose identification takes place through exact description, this can only take place through a previously made differentiation (cf. chapter "Understanding"), it follows that a word, a drawing or description can only evoke the same understanding in the receiver that the sender has if the latter has made exactly the same identification as well as differentiation.

■ Communication – is understanding, miscommunication is misunderstanding

■ Communication techniques

People have optimized language for themselves, not only to be able to represent situations, but also to be able to convey new contexts and new situations to the other person. In addition, technical aids were invented to make communication, the transmission of ideas and actions, independent of time and place. We call this writing, multimedia, telephone, etc.

■ Effects of "defective" communication

Communication, correct communication, is therefore a fundamental building block of life for people and social interaction. If communication no longer fits, because words have different meanings, misunderstandings arise and people can no longer communicate with each other. Social togetherness is completely lost, people can only communicate insignificant things with each other. Life is not possible like this in the long run. People will divide, will go against each other, because they no longer understand each other.

■ The importance of change

Communication is thus a much more important tool than we ever imagined and we need to re-learn meaningful communication in the future. For this, there are technical tools to be able to work temporarily with images, with instructions for action. This importance, that not every opinion, every word is used for everything, because otherwise it will be lost and will no longer be available to mankind for meaningful communication, must be urgently considered again. Otherwise, we as humans will no longer have the possibility to communicate with each other in the future, to be able to agree and live together.

■ Everyone is called to protect their life

Now that this is known and we as human beings become aware of all our functional possibilities, agreeing on word meanings and providing meaningful communication should become the endeavor of all of us in order to be able to realize a life worth living. Protect your life with it now!

■ Communication – Redefining the importance

■ Problem of increasing knowledge

Due to the daily massive increase of knowledge, which refers to the most different situations as well as the changing situations of living environment and habits as well as technology, the requirement for differentiation and identification explodes, so that one can assume that hardly a sentence is pronounced by one person anymore, which meets the same understanding with the other person.

■ Redefining communication

This makes it clear that communication with language will lead to more and more misunderstandings and misinterpretations in the future, which will ultimately result in people no longer being able to act together. They can still exchange their opinions and if the feeling fits somehow talk and communicate with each other. However, actual goal-oriented action will hardly be possible anymore.

■ **Communication – The new possibilities due to BCOL**

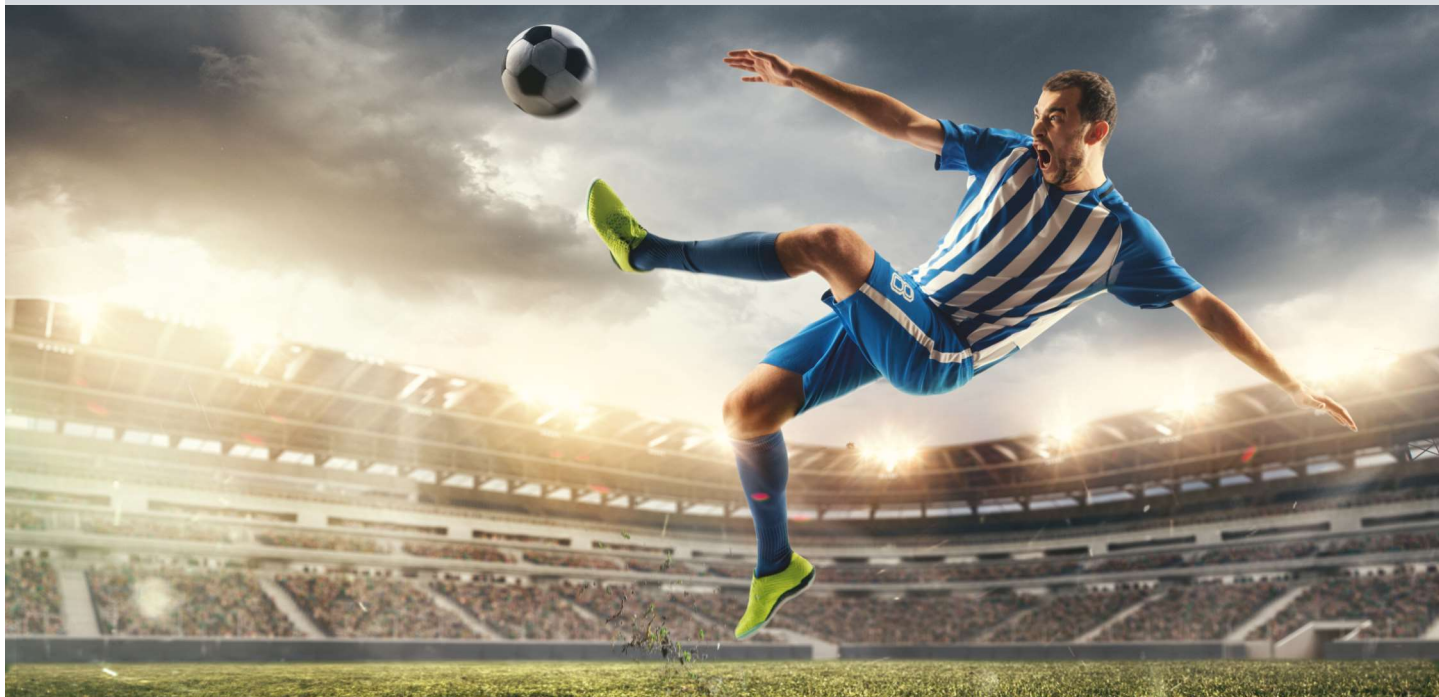

■ **The possibilities**

Through the discovery of BCOL, among other things, the basis of communication could be fully explained. In the meantime, technical tools are being implemented that cover precisely this area and will enable uniform communication worldwide in the future, taking into account the factors Integrity, Functionality, Economy and Organization (IEFO). For this purpose, a completely new technology has been specially developed that is capable of communicating logically, and this across all known

media formats, thus with people as well as with machines.

■ **We can do it!**

Together, with unified communication and the current understanding, we can build a wonderful future, let's do it!

4. Training

Training methods

We are looking for partners
to expand this branch!

■ Let's create a future of quality together

■ **The full quality of life** based on the understanding of life, nature and habitat, technology, economy and organization – life success.

■ **zoe Life Success Factory.** Zoe is ancient Greek and stands for life and the nature of life and could not be fully explained until the discovery of Balanced Cooperative Operational Logic (BCOL) and its manifestation. BCOL describes the function of nature, its automatic organization and stability. In addition, topics such as the coexistence of mankind, the functioning of the habitat and also the functioning of the brain, thinking and understanding. A life in harmony with life & nature (BCOL) automatically means an individual life of high quality.

■ **BCOL – Technology as an Assistant: "Actionstep"**
BCOL could be converted into a technology – a kind of processor – which makes it possible to perceive, logically deduce and combine changes extending over the whole world in real time like the human brain. It can thus assist humans while protecting nature and life.

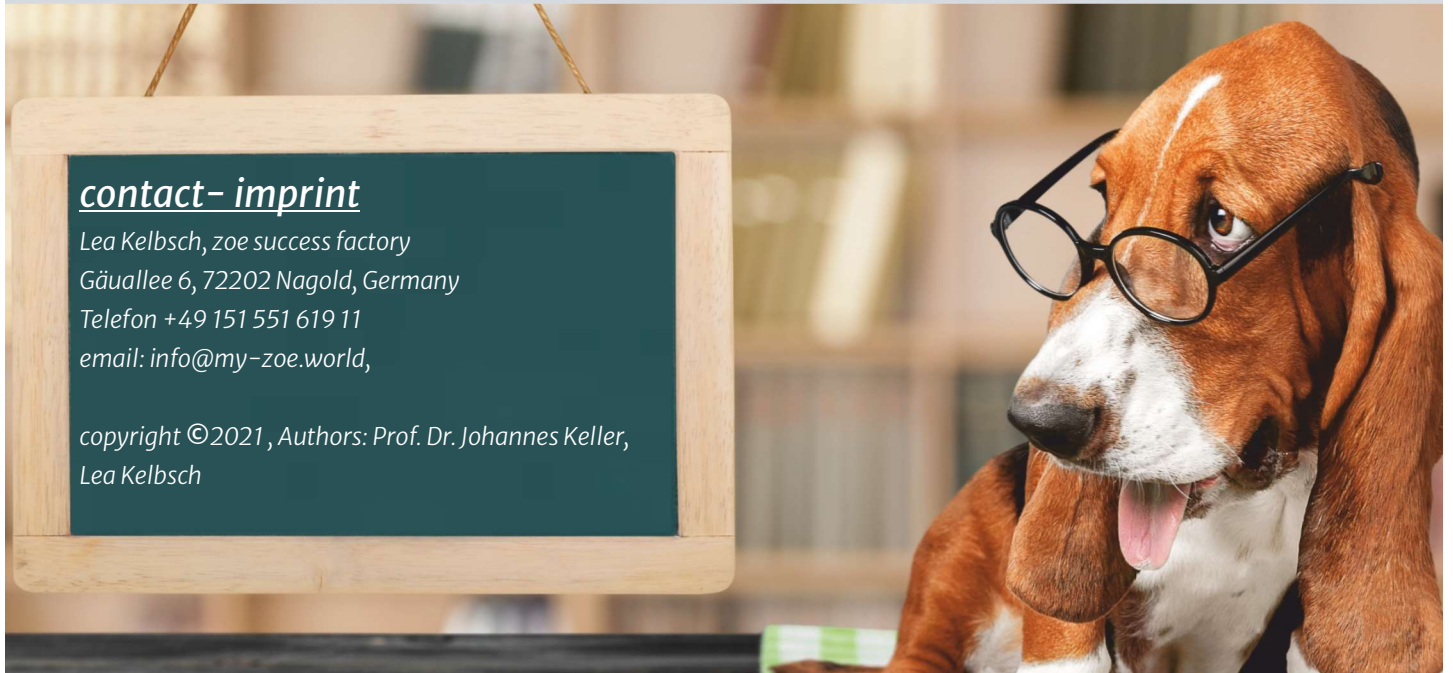

■ **BCOL – new nature-based technologies**

BCOL enables nature-friendly, highly efficient new technologies, both in machinery and in energy production. These are developed and implemented with partners.

■ **Get involved now** so that this understanding, the resulting opportunities are being spread and used across the world. Understanding is the prerequisite for people to be able to deal with themselves, life per se and nature with understanding. All people, industry, trade, service, health, government, education, training, science, etc. benefit from it. Assistants like Actionstep enable the basis for a common understanding, organization and individual action.

● **zoe Life Success Factory**, together with partners, takes over the part of the organization and provision of the means and possibilities.

➤ **Together we create the clear goal of a future of high quality, for every life in a high quality habitat based on BCOL, KHEO and IEFO. Become part of life**
