

Live Life
and Understand it.

 **SOCIAL**
Integrity for life

■ MISSION LIFE Life, understand yourself, live quality.

▲ **Our universe, existence, everything around us we call nature. Change is the basic operation of nature.** Everything we can see and touch is subject to constant change. Some change is directly perceptible (wind, heat, sounds, light). Other change can only be perceived due to the differentiation of before and after, i.e. by referring to the previous state in memory. Such changes take place slower for us, e.g. the celestial bodies move (resulting in day and night). Change is thus the basis of our existence and ability to act. Without change there would be no possibility of interaction, perception or life.

■ **The discovery of BCOL** by Professor Johannes Keller (University of Ulm) in one of the most extensive research programs concerning human understanding (cognition), the process of how life, thinking, understanding, man and nature are interrelated, could now be fully explained in a logic BCOL "balanced cooperative operative logic". Thereby a new self-understanding emerged.

■ **This new self-understanding** opens up to us humans completely new foundations and new possibilities for action and a complete understanding

in dealing with ourselves and other people, respectively with life and nature.

● **Read now** and learn why and how social is important for you personally, as well as on what basis you can put your life on a higher quality level. You will learn why there have been so many unanswered questions in the world so far and that there are now answers for them. Afterwards you will see the word "social" in a completely different context and will be able to deal with yourself and your environment in a completely new way.

After reading this, you will be able to look at your life and the lives of all people with completely different eyes and see possibilities that will allow you and all other people to have a completely different new quality of life and livelihood.

✎ **MISSION LIFE – Benefit from the full range of one's life, through one's own unfoldment as well as that of all other life.**

■ Social – together and capable of action

■ Us humans commonly measure ourselves by our social attributes, one perhaps a little more, one a little less. In fact, "social" seems to define a basis of human coexistence. But what is really social? There is still no agreement on this, although it would be important, on the one hand for our own self-definition, on the other hand for the definition of society.

■ Social – the areas make namely that, how our life runs, which possibilities we and other people have,

how school education functions, the disease system and also taxes. But the tragic thing is that because the meaning and life of man could not be defined exactly until 2021, the term social could never be defined correctly.

■ Read now how due to the work of LON- science (Logical Operational Natural Mechanics) and its decoding of life, understanding and thinking can be socially defined. You will get a new picture of life, yourself and other people.

■ Social –together and capable of action

■ The social measurability

I am helpful and social, we are social. What does that actually mean? Is there a measure of social?

■ People can stay away from me

I do not need a person, either you do as I want or you can stay stolen from me. Each person should live as he likes, only he must not disturb me. Everyone has his faith, as long as this does not concern me. There are many ways of life, I live mine and to whom that does not fit.... – There is a living space, an atmosphere a nature people share this and people need people?

■ The definition of social

In the past, "social" had many different meanings and could not be defined precisely. One calls it social when a person is allowed to end his or her own life, the other when one helpfully donates something from one's assets. The interpretation of "social" ranges from "common" to "capable of action". A precise definition has not yet been possible.

■ In 2020/21, presumably no one could claim to have never encountered the terms "social" and "human dignity".

However, these concepts were completely misunderstood until then and for many people factually meaningless, anti-social conditions prevailed in the world as never before.

On the one hand, there were technologies and possibilities that would have made it possible, without really taking anything away from anyone, that all people could have lived in dignity, that the living space could have been shared. A common ability to act could therefore have been achieved. Mankind also had more money and assets than ever before.

On the other hand, immeasurable suffering and misery could be observed all over the world. The following figures are known: There were about 82 million refugees due to wars, about 30 million people died of hunger, 155 million people suffered from starvation, and 745 million people lived in extreme poverty, there were natural disasters and storm damage like never before in living memory. The number of mentally ill people reached record levels, as did drug use. There is no animal species known on earth that lives under such anti-social conditions as humans.

A general operational order is missing, which functions in such a way that a life worthy of man becomes possible for all.

■ Social – Without logical definition every belief or opinion is correct

■ A logical definition requires understanding

Due to the fact that the meaning of life as well as the mission of life could be pronounced only since the discovery of BCOL, it is possible at all to specify "social" – we use the term Integrity – exactly. In any case, "social" has something to do with autonomous living beings, such as we humans are. A possible interpretation of "social" could be "capable of acting together".

■ Together

But what does common mean in this context, and what does capable of action mean? To understand this, we must first understand the human being as an autonomous life, in its nature, the basic needs. Together can have many meanings, for example, do we all need the same house, or do we all need the same food. So this is again interpretable in any direction or opinion. Everyone believes then again in something what he means, which would have to be right. That is certainly not social, but automatically again anti-social. Anti-social means, everyone like he thinks. That leads automatically in a same living space to misunderstandings and disorder.

■ Capacity to act

Also ability to act is a term, which could not be defined among humans so far generally validly. This due to the fact that man and his nature could not be defined flawlessly. Again there were many opinions and beliefs. Simple was then to say, everyone is individual, there is neither man nor woman, we know only human. In the social thinking this led to it, we give to everyone a basic security or a basic income, with it he can live then. Again, only when the understanding of life is given, can we determine what means capable of action. With animals, if we keep them in an enclosure, the opinion is often held that this would not be correct, the animals would die, even if they get food. This because they are not capable of acting. For humans we have so far omitted this logic. A schizophrenic aspect of the social policy, which carries perfidious features.

1. Understand nature

Nature – the basis
and producer of life and the living space

■ Social – How do you capture "social"?

■ The foundation – our understanding of nature & life

As long as we have not understood the nature and the nature of human life, it is logically nonsense to want to claim that one knows what social is. This can have been so far only an assumption, on the basis of the own experience, perception and logic, however, not in the remotest way as fact or generally valid to be regarded. At most, that the majority agrees with this point of view, which again is no proof of a fact. It only means that the majority perceives it that way, even though it may be completely wrong. The past showed many such episodes.

■ Quantitative measurability

The whole thing becomes even more perfidious when it is tried to make the term "social" look like a fact or truth with quantitative measuring methods. This speaks of a complete misunderstanding and misperception of nature. Life means that it happens over time and is not owed to a moment. It is therefore a sequence of events, I am living. Socially, therefore, since it is about life and life possibilities, can never be measured quantitatively in a moment, or by a quantitative method over time. Life is always a process of time and the ability to act, this is one of the most important quality characteristics of life. Accordingly, "social" must be expressed qualitatively.

■ Social – logic and nature

■ The quality

Quality is the characteristic that something with appropriate use and care over time permanently fulfills its purpose within this time completely, without being subject to appropriate wear or defect. In the case of an autonomous living being such as a human being, this would mean that one would first have to know what the purpose of the human being, i.e. the meaning of life, is and also one would have to know what is the use, what is the care. Without these understandings, therefore, neither quality nor conditions can be formulated. However, this was not possible until now due to the lack of understanding. The discovery of BCOL makes this possible.

■ Understanding nature & the basis of life

BCOL – balanced cooperative operational logic – describes how everything in our existence works,

the operation of our nature, in a logical, always the same interaction. With this, every situation can be explained and made comprehensible. BCOL describes the interaction of objects as well as the communication, the thereby occurring interactions, thus also quite clearly the operation of our nature as well as our habitat.

■ The operation & function of nature

BCOL gives the understanding that no matter what we do there is always an interaction with other objects and this represents a change in the habitat. It describes the cycle and interactions of nature (read the book "Habitat and Nature") and explains the relationships of the physical law of conservation of energy as well as the process of entropy described in the principles of thermodynamics.

■ Social – interaction in the habitat

■ The basis of capacity to act

Cooperative expresses that all objects, all interactions in our existence and habitat always have influence and interactively influence each other. Balanced stands for the fact that the influence takes place exactly balanced to the relation of the one to the other object.

■ This is imaginable e.g. in the fact that a drop of water falls into a lake, cooperatively the water molecules lying around make place for the one drop, this results in a circular wave which continues itself ever

further and becomes weaker sometime, i.e. the whole balances itself over all available water molecules. At some point, you no longer see any wave at all, because there is only very little displacement.

■ Cooperative capacity to act

This is the basis of our nature, that everything is "cooperative" and "balanced". The reliability of this logic makes existence and life possible, is the basis of everything. That means, it is the basis for a habitat and nature to exist at all.

■ Social – One for all and all for one

■ A fool is he who thinks everyone as he thinks

If certain water molecules were not willing to cooperate, to interact in their relationship, then we would no longer have liquid water. Because the molecules would refuse to change their place, their place. Our blood could no longer flow, plants and trees could no longer feed themselves. Life would no longer be possible. The universe would no longer be possible.

■ A fool is he who thinks that each individually

If the molecules were not ready to cooperate "balanced", to interact, then the drop would cause an elevation in the water, water would run up the hill or simply fly away, because it would not be balanced to other objects and molecules, a pure chaos.

■ There is a basis – a functional order

BCOL is a logic of operation that describes all the interactions and interactions in our existence. Everything we know acts exactly in this way and only on this basis an existence and an order is possible. Through the operation according to BCOL a habitat could come into being. As soon as nature would oppose this or every organism would do what it thinks, then disorder and chaos would arise, any ability to act would be lost. The existence fights itself then, nothing goes anymore.

■ Social – logic and existence

■ BCOL, the operation of nature – the security

BCOL thus describes interactions, the perpetual change, that nature due to its natural operation is in a process of constant change, that there can be no standstill, since everything interacts with each other balanced cooperative, thus the present situation is the starting point of the next and this endlessly. The process of order creates as a result the habitat.

■ A Clear Order and Operation

The existence is subject to a clearly ordered procedure which every object is subject to and follows. The appearance perceptible for us may be disorderly, it also changes constantly due to the interactions, but these changes are the possibility for existence to be permanently possible and a habitat for life to have come into being. We can rely on water

behaving like water, light behaving like light, sounds behaving like sounds, etc. A reliable operational order, i.e. reliable temporal processes.

■ Basis of existence, diversity & individuality

With this order it was possible that the existence originated from the "nothing" (whether one calls this as "nothing", as "God" or completely differently, is irrelevant), that everything spreads interacting with each other, the universe, the nature forms itself balanced cooperative, the earth with its habitat originated, the nature created the life, exactly using this order according to BCOL, the life created again a brain, based on this logic, and thus understanding autonomous life originated. Life can keep the order within this order and on basis of the order individually interacting.

■ Social – individuality is always balanced

■ Individuality due to operational order

First developed plants and animals that balanced themselves. Then the human being with special abilities due to his physique, e.g. to develop tools and skills to adapt the habitat to his needs and to learn to understand.

■ Understanding is the basis for operational order

The discovery or manifestation of the BCOL has been now the last step to explain the nature, the universe and its function fundamentally and to make it possible to be able to explain and to work

out every situation to enable life on the basis of the nature-given order to protect itself like the habitat.

■ BCOL has thus precisely defined the nature of life and the task or meaning of life:

● The nature of life is to live, to fully use the given abilities as well as the understanding given by nature, in order to protect life, one's own life and thus also all other life, such as the natural habitat with all means.

2. Understand life

The nature of life
the basis for life and quality

■ Social – laws restrict

■ The basis

On the basis of this basic law, the basic operation, now "social" or Integrity can be explained and derived perfectly. Only if we have done this successfully, we know at all what life, the existence of life actually needs. Life is, as noticed in the meantime, no object, which one cleans and makes clean, then it is maintained. Life is autonomous, in a living space, i.e. it has requirements in the course of togetherness, i.e. in the "social". These must be understood as described in the chapter "Understanding" on the basis of an operative order.

■ Operation – The function of something

Operation means, something functions and works. A function is to be understood thereby in the fundamental difference to a law. A law is a restriction

of a function. Up to now we humans knew best with laws when it was about our life, however, much too little with functions and processes, although life is always and quite naturally a process.

■ Unknown function or operation

This already alone because we were not able to define the function or operation – neither that of nature nor that of man – or to express it within an operative logically inferable logic. It was not known until the discovery of BCOL how to express an autonomous function or even the order of nature. For certain areas we could express a regularity, so e.g. the gravity or the law of conservation of energy, but we were not able until then to define why energy is not lost, which function or operation is behind it.

■ Social – only works with a space of freedom

■ Laws restrict possible functions

Because of this, we had to pass laws to limit the operations or the functions that an autonomous life could perform. This compulsorily, because otherwise only the power of the stronger would have been valid at this moment, therefore a continuous disorganized anti-social behavior. However, we could not determine, how does a social behavior look like, also not why anti-social behavior is just as harmful for the stronger one. There was just no understanding how life and nature works.

■ No quality without understanding

Quality and intrinsic value are interrelated. As already mentioned, quality is a functional time-related characteristic. This means that the function of something is possible without restrictions over a certain period of time if it is handled and cared for correctly. If now neither the function nor

the "care" is known, then the quality characteristic of the object is very questionable. Only the understanding of the function and care, i.e. the necessary attention, enables a definition and statement about quality.

■ Controlled operation, function

To be able to speak of function or operation, the criterion is that an object interacts within time. And if it is only simple functions, like a table. We know more complex functions from machines that perform complex processes under computer control. AI-controlled robots can perceive change in a quantitatively defined environment and interact with it in a differentiated manner within their regulated spectrum. They do this by developing their own new rules within the spectrum assigned to them on the basis of sensors and their data and by working on the basis of these rules.

■ Social – autonomous life is logical

■ Sets of rules as the basis of life

However, the basis was always a set of rules. Due to the expansion of machines, countless new sets of rules emerged that could neither be traced back to an order or a uniform understanding, nor was it possible to bring them into harmony with each other. With homogeneity opposite humans and nature this had nothing to do for a long time anymore. The people had to follow however inevitably, most did not notice this at all, these sets of rules, since the life was made possible only by these. However, since no other understanding was available, this was finally the way with which one thought one could become successful and protect the life like nature.

■ Autonomous life is operation based on nature

Autonomous life means interacting every moment, the heart beats, the brain works. Even when we sleep. This is a characteristic of autonomous life. Autonomous life is not subject to any set of rules, like nature. It simply uses all the capabili-

ties that nature provides to operate. As well as nature. By the operation of nature, corresponding possibilities or impossibilities arise naturally within nature, its cycle. Now these can be expressed operatively: one can do that. Or one can express them lawfully: one must do so or not do otherwise, thus restrictively.

■ Operational logics – their effect was well known

Operational logics were dealt with every day until the discovery of BCOL, but they were not logically defined and one could not yet bring them into a generally valid context, i.e. an understanding. In physics, for example, the law of conservation of energy, whose perception is based on an operative cycle, as well as the disorder number entropy and the corresponding thermodynamic law. However, only the constraint could be described, but not the operation of the system. Therefore, until the discovery of BCOL, there were different laws of nature. But only one nature.

■ Social – people, animals and nature

■ Autonom operational

Autonomous life like animals and humans show by their autonomous behavior, i.e. by the fact that they are able to interact with the habitat in various ways, that there must be something that enables them to deal operationally with nature. Babies, for example, cannot walk or see correctly when they come into the world. They only start to explore their habitat, to play with it – i.e. to interact – until they can predict quite well what the result of an interaction will be. They do not follow any rule, but use the natural operation in interaction with their own.

■ Autonomous operational – without any rule

This means that an autonomous life knows no rules, it uses the possibilities of the living space. Why should it use rules that restrict autonomy? The mere thought of rules does not allow autonomy.

■ The operation of nature is their livelihood.

With animals it is to be seen very well, their rule is the life, most of the animals have neither school

education nor street signs or a basic law and nevertheless you live mostly in social packs together, you use nature, in order to ensure their own life. Many animals like wolves, ants, bees or even dolphins have a complex operating principle. This has been working for thousands of years.

■ Autonomous life of the human

Now one could get the idea that humans with their thinking, feeling and acting would be much more complex and also more intelligent than animals are. This is a fundamental error, superstition, which originates from the time when BCOL and the operational logic, which is responsible for autonomy – the "blueprint logic" – were not yet known. Humans depend on the habitat of nature and share it just like any other living being. Perhaps if one takes now wars or the failure the permanent against each other like the destruction of the own habitat, then one can say, no animal has been so on it to weaken itself and/or its kind so and to go against it like the human being. Does it fit to call this intelligent?

■ Social – understanding enables coexistence

■ Here it is confirmed: No quality without understanding

In fact, the behavior is based on a misunderstanding, that of the laws. An autonomous life can be bound to laws only limited, this as long as the possibilities of the interactions are described exactly. No more if these possibilities grow, because then a law would have to exist for everything new. This does not work. There must be an understanding for the operation of autonomous beings, with which one can show the possibilities of these.

■ The cavemen had this division

With the cavemen it was still clear how the autonomy was used: a division of tasks, the responsibilities were structured and thus a life was possible. Everyone according to his abilities, completely individually. Every advanced civilization then started

at some point to restrict, not based on abilities, like the cavemen or in the animal kingdom, but based on skin color birthright etc.. Then forms of state were developed, socialism, democracy, dictatorship, etc. It was always the attempt to achieve a "social" functional community.

■ The understanding of autonomy

None of the forms has been able to survive in the long term. Either man and his autonomy was bound to money, then destroyed the habitat, or to some other rule. The problem was that man was not able to find an understanding for himself, that is life and his habitat. This is now fundamentally different since the discovery of BCOL, it will be seen whether man still manages to preserve himself and his habitat, or whether it is already too late in the meantime.

■ Social – Future only works with nature

■ BCOL changes the foundations of understanding

BCOL is not limiting but opening, following nature and its operation, is an operational logic given as a birthright to animals as well as to any other autonomous being. This operational adaptive logic "blueprint" acts due to perception of the logical interactions of nature, it is the "cause" of a baby being born without understanding of nature and yet after some time being able to deal with nature and environment.

■ Blueprint logic – the understanding of autonomy

Thus, operational blueprint logic is the understanding of how autonomous life comes about, understands it, and interacts with the habitat. The key to this is that we humans can now finally define our nature and meaning of life logically and thus discard the rules of law and interact with understanding towards ourselves and thus towards other life.

Because nature works cooperative balanced, so does the Blueprint logic. The only thing that has not been cooperatively balanced so far has been the opinions and the illogics due to the prevailing lack of understanding of nature.

Understanding means that an organism can comprehend and execute a process and its order.

■ The understanding – the basis of future

This understanding provides the basis for a high-quality future. The question is now whether we humans successively replace the faulty opinions and beliefs with new high-quality operational procedures, thus enabling us to live a high-quality life or not. All who have worked on these elaborations would wish for themselves and for all other life (quite egoistically) that we humans get this implemented.

3. Social / Integrity

Basics of togetherness

■ Social – foundation and necessity of life

■ The operation and explanations

The following is an explanation of how BCOL functions within autonomous life. Through this, the term "social" can then also be defined logically. Now surely every reader is already aware that "social" will get a completely different, new meaning. It is certain in the meantime that "social" represents a basis of life, which has nothing to do with other people, but is valid for every life in the same way, thus is actually universally necessary for survival. If you now read on, you will understand this.

■ The skills and necessities of life

Since the existence, the nature and our habitat is based on a reliable logical functioning, this is therefore the basis of existence and the habitat, it follows that life arose, which in turn adapts the same reliable logic to live. Autonomous organisms use this logical functioning complementarily in the brain as blueprint logic. That means that we are a logical image of nature, using its functioning or operational order to be able to live.

■ Social – Respect nature and the body

■ Disregarding nature

Therefore, any action that we do not act in a balanced cooperative way in harmony with everything that surrounds us, is nature-changing against nature, thus against ourselves and life (see the chapter "Nature and Habitat" as well as the description of the technologies).

■ Lack of understanding of the body

This is easy to understand with a visible example. Our body needs space in the habitat in order to be able to develop. It needs food, water etc. This is given by nature in such a way, with it compellingly to keep, otherwise the body survives only for a certain time and then dies. But also this must be

balanced. If too much food or energy is supplied, the functioning is impaired, the body takes in more energy than it gives off, this is neither cooperative nor balanced.

■ Understanding the entirety

With the body, we now understand some of the processes. In the near future, BCOL can also be used to explain and describe the other processes, the functioning of cells, genetics, and so on. Thereby, if you express the whole thing not in rules but in operative logic, there is only little to understand, because these operative logics are implemented by the brain within fractions of a second. Read for this the books "Understanding" and "Consciousness".

■ Social – the power of understanding

■ Social means living yourself and your life in a quality way

Socially (or Integrity) can mean therefore only that a life behaves balanced cooperative opposite itself, thus its body, opposite nature and the social environment. This is not because there is a compulsion to do so, but because basically the body comes to harm if the BCOL is violated or disregarded and this would be directed against nature, thus also against one's own nature. If one does not pay attention to his own life, then one acts accordingly already anti-social. How will one then only act towards other life and the habitat?

■ The autonomy, the understanding

So far, we have not been able to identify the nature of man. Everything we do not know, we try to explain with something. Our brain always needs a closed logical circuit for everything, the explanation. If one does not have this, then one assumes. Up

to the discovery and manifestation of the BCOL there was also no possibility to be able to prove and prove something exactly definitely logically. Therefore one had beliefs or empirical scientific statements which one considered as true until they were disproved by something else.

■ Identify incomprehension

Instead of classifying something incomprehensible as "not resolved" or "we don't know that", opinions and assumptions have been manifested. Since the brain logically converts what it perceives due to its operation, these opinions and assumptions were perceived and confirmed by the brain. Thus, in the people who have classified these opinions as confirmed, this perception has been used by their brain to adjust the actions to this perception. This is an automatism due to the operation of the nature (and therefore of the brain).

■ Social – our understanding builds the brain

■ The "comprehension bubbles"

Thus the consciousness of these people was separated from the operation of the BCOL. Man builds his own virtual world with it, independently of the real tangible nature. He is no longer able to see the natural processes in their order. A disconnection from real life develops, a schizophrenia, a world of one's own, which exists virtually, but makes the person unable to survive in the long run. This also damages the communication with other people, because exactly these misinterpretations are passed on and other people also perceive and adapt this.

■ Faulty understanding – faulty perception

Our perception and our conscious thinking are the food for our brain, whose synapses physically and physiologically adapt the perceived logic on the basis of the perception by actually building up like

this and thus manifesting the thinking in this form. (Described in "The secret" and "Intuition", "Understanding" and "Consciousness"). Although the brain is able to replace these connections by others without any problems if the human being is consciously willing, one has to be made aware of it first, because one does not become aware of it oneself, since one's own brain thinks exactly in this way.

■ BCOL – the solution

BCOL is the solution here as well, as it enables everyone to check and correct their thinking. BCOL is also adapted by the brain through intuitive training after a short time, thinking becomes clear and fast. There is now a technology that can adaptively train the independent with each person within a short time.

■ Social – Understanding shapes life

■ Autonomy and understanding is innate

Until some time ago, people were actually still convinced of being particularly intelligent with a certain mission or due to their genetics, completely disregarding the fact that they were born like all other people without being able to speak a word or walk, let alone deal with mathematics. In fact, however, the ingenious ability to understand something has been put into their cradle by nature, like every other physically healthy person.

■ Opinion, erroneous belief limits life and autonomy and harms others.

It is crucial how many false perceptions a person has adapted in the brain during his life, which prevent him from understanding nature. This highlights the different levels of understanding among

people. Fundamentally, the way the brain works is the same for everyone. Having 10% more or less brain mass doesn't really make a meaningful difference, because processing BCOL only takes up a few portions of our brain.

■ Individuality – the appearance

What is certain, however, is that the body, its specific training (large or small) influences physical abilities. One sees better, another hears better, one can run faster, one releases a little more adrenaline, the other less, and so on. Accordingly, certain areas of the brain have become more networked and specialized. These are then the individual strengths, but as long as the body of a person has no defects, it can be trained just like that of any other.

■ Social – the organization of the living space and the quality of togetherness

■ Organization – sharing a living space in an organized way

Organization on the basis of operational order means that life uses the habitat together and everyone is aware that his action is an interaction in the habitat and will influence all life in it. Organization therefore requires the awareness of being dependent on everyone observing BCOL in their actions.

■ Integrity, Economy, Functionality, Organization

Briefly named "IEFO" is a logical operational procedure, which makes it possible to logically infer all operational possibilities and actions of people in real time via an appropriate technology. Thus, it is possible to act efficiently without harming other people, organized in harmony with nature. Under complete consideration of the individuality of the single life. For this, based on the Blueprint logic, a technology exists in the meantime, which can protect and advise humans (see "Technology").

■ Social – the right expression

■ IEFO – a holistic, logical-operational system

Based on BCOL, as well as a corresponding logical technology based on it, a holistic procedure has been developed in the meantime, which takes into account the changes of nature as well as the individual autonomy of life and yet enables a complete organization "socially".

● Integrity / "social" must correspond to the nature of the human being

Accordingly, following the nature of life, social (or integrity) can only mean to act according to life, to do justice to its basis, functioning and operation.

■ Social – can be lived only qualitatively within time

Social is thus not a state, it means that action and thought are in accordance with the nature of life and the conditions that action is taken in accordance with nature without harming or causing harm to one's own life or other life.

● Economy, habitat, condition for life

To ensure economy means to protect nature, habitat and also to ensure the supply necessary for life.

● Functionality, use BCOL for yourself and for others

Functionally using life with all its capabilities to enable life in its entirety means using one's own life according to BCOL for oneself and for others. Adhering to BCOL means always ensuring one's own benefit as well as the benefit of others in actions. Balanced cooperative action can never be to the detriment of an organism.

● Organization to share a living space in an organized way

Organization on the basis of operational order means that life uses the habitat together and everyone is aware that his action is an interaction in the habitat and will influence all life in it. Organization therefore requires the awareness of being dependent on everyone observing BCOL in their actions.

■ **Social – KHEO– a common understanding and action, completely individual.**

■ **KHEO– a holistic, logical–operational system**

Based on BCOL, as well as a corresponding logical technology based on it, a holistic method has now been developed that operates optimally on human understanding according to BCOL. It enables the transfer of understanding on the fly, over the entire world.

● **Knowing – The knowledge of something**

Knowledge means that I have perceived something, but the logical connections are not (yet) understood.

● **Knowing–How – The logical relationships**

The knowledge of logical relations according to IEFO. With this, a person can logically reason, infer, etc.

● **Knowing–How–To–Do – The own action**

The knowledge about the action, about its execution.

● **Execution – The actual execution of the action**

The actual performance of the action, that is, the real interaction in nature.

■ On the basis of BCOL, it has now been possible to develop a technology, from this a software web-based, which is available as an assistant to anyone at any time and in any place. With it, education, training, instructions, organization, etc. can be provided. Especially due to the ongoing knowledge expansion, people will be more and more dependent on such assistants in the future. Assistants based on BCOL or Blueprint logic provide the security to enable understanding in a human way, thus supporting and protecting humanity. The system allows complete individuality and at the same time an organized cooperation.

■ Social – shaping the future

■ The meaning of "social"

Conclusion: Accordingly, socially means to respect one's own life, to train oneself the right understanding and intuitions, due to the abilities of one's own body. Disrespecting one's own abilities means disrespecting one's own body, one's own life, accordingly not living in balance, which will be reflected both physically and mentally and will limit one's own body and abilities more and more. What ultimately leads to the fact that life will no longer be viable, it will also not reach the quality of life, which is actually assigned to life by nature.

■ Tackling the future with quality.

With the discovery of BCOL, it is now possible to optimally describe the way of life and also the life to live a quality life.

■ The actual logical meaning of "social"

To live socially or in Integrity means accordingly, it is a way of life and a way of living which aims first of all quite egoistically at one's own life and is to be applied to one's own life. If the correct conception and the correct understanding is known here and is lived after this, this means to use the own body, the own life, the own spirit in optimal relationship, to bring in the own life and its abilities optimally within nature and the habitat, in order to protect itself, the habitat, the own life as automatically with it also each other life. This means, to live in Integrity i.e. socially is qualitatively the highest good, which one can "do" to the own life.

■ Let's create a future of quality together

■ **The full quality of life** based on the understanding of life, nature and habitat, technology, economy and organization – life success.

■ **zoe Life Success Factory.** Zoe is ancient Greek and stands for life and the nature of life and could not be fully explained until the discovery of Balanced Cooperative Operational Logic (BCOL) and its manifestation. BCOL describes the function of nature, its automatic organization and stability. In addition, topics such as the coexistence of mankind, the functioning of the habitat and also the functioning of the brain, thinking and understanding. A life in harmony with life & nature (BCOL) automatically means an individual life of high quality.

■ **BCOL – Technology as an Assistant: "Actionstep"**
BCOL could be converted into a technology – a kind of processor – which makes it possible to perceive, logically deduce and combine changes extending over the whole world in real time like the human brain. It can thus assist humans while protecting nature and life.

■ **BCOL – new nature-based technologies**

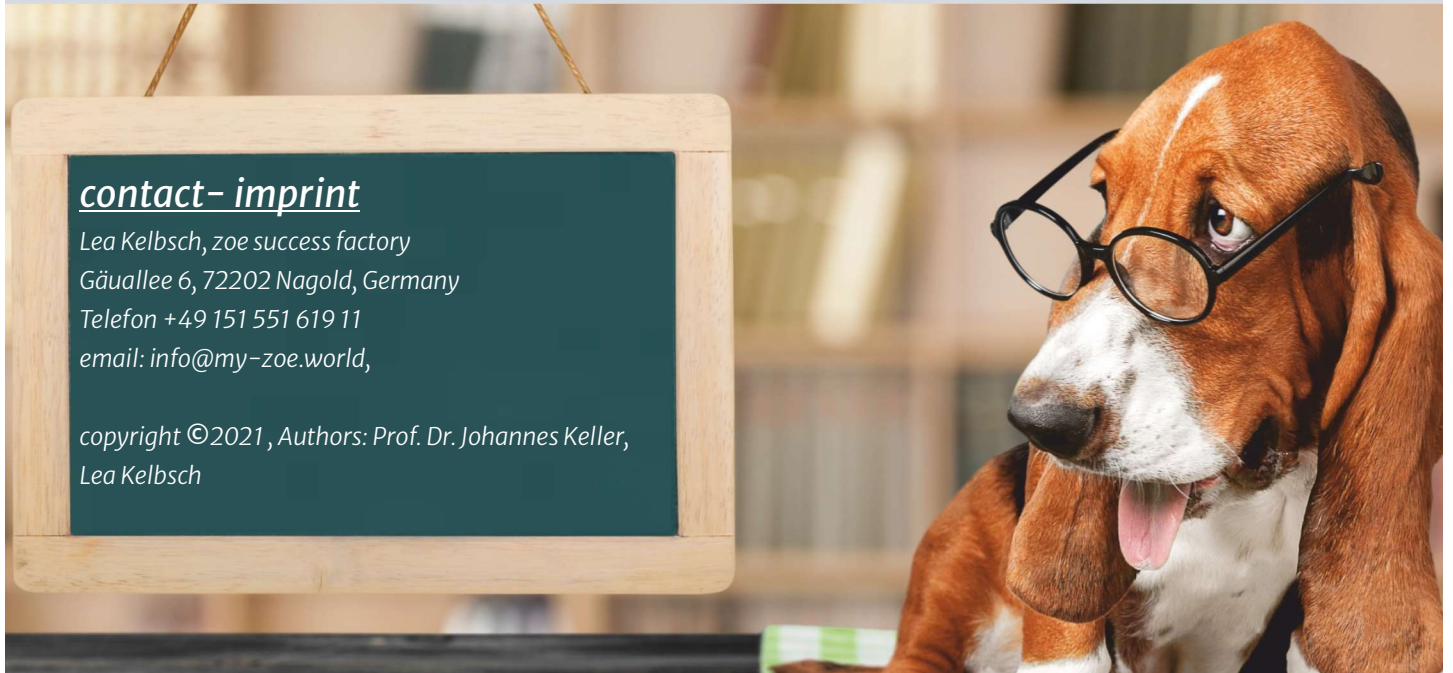

BCOL enables nature-friendly, highly efficient new technologies, both in machinery and in energy production. These are developed and implemented with partners.

■ **Get involved now** so that this understanding, the resulting opportunities are being spread and used across the world. Understanding is the prerequisite for people to be able to deal with themselves, life per se and nature with understanding. All people, industry, trade, service, health, government, education, training, science, etc. benefit from it. Assistants like Actionstep enable the basis for a common understanding, organization and individual action.

● **zoe Life Success Factory**, together with partners, takes over the part of the organization and provision of the means and possibilities.

✎ **Together we create the clear goal of a future of high quality, for every life in a high quality habitat based on BCOL, KHEO and IEFO. Become part of life**

.

Let's start ...
