## PART 1: Survival Copula.

# Definition

- ▶ The probability of an individual living  $\mathbf{X}$  or "surviving" beyond time  $\mathbf{x}$ , which is called **the survival function**

$$\bar{F}(x) = \mathbb{P}[\mathbf{X} > x] = 1 - F(x).$$

- ▶ For a pair  $(\mathbf{X}, \mathbf{Y})$  of random variables with joint distribution function  $\mathbf{H}$ , **the joint survival function**

$$\begin{aligned}\bar{H}(x, y) &= \mathbb{P}[\mathbf{X} > x, \mathbf{Y} > y] \\ &= 1 - F(x) - G(y) + H(x, y) \\ &= \bar{F}(x) + \bar{G}(y) - 1 + H(x, y)\end{aligned}$$

# Survival Copula

- ▶ Assume that  $\mathbf{C}_{\mathbf{X}\mathbf{Y}}$  is the copula of two random variables  $\mathbf{X}$  and  $\mathbf{Y}$ . From Sklar's Theorem, one has

$$H(x, y) = C(F(x), G(y))$$

- ▶ Rewrite the survival joint distribution function

$$\bar{H}(x, y) = \bar{F}(x) + \bar{G}(y) - 1 + C(1 - \bar{F}(x), 1 - \bar{G}(y))$$

- ▶ If we define a function  $\hat{C} : \mathbb{I}^2 \rightarrow \mathbb{I}$  given by

$$\hat{C}(u, v) = u + v - 1 + C(1 - u, 1 - v),$$

we have

$$\bar{H}(x, y) = \hat{C}(\bar{F}(x), \bar{G}(y)).$$

► We check the following conditions

- $Dom\hat{C} = \mathbb{I}^2$ .
- For any rectangle  $K = [x_1, x_2] \times [y_1, y_2]$  lying in  $\mathbb{I}^2$  then  $K' = [1 - x_2, 1 - x_1] \times [1 - y_2, 1 - y_1]$  also is a rectangle within  $\mathbb{I}^2$  and

$$\begin{aligned}V_{\hat{C}}(K) &= \hat{C}(x_2, y_2) + \hat{C}(x_1, y_1) - \hat{C}(x_1, y_2) - \hat{C}(x_2, y_1) \\ &= C(1 - x_2, 1 - y_2) - C(1 - x_2, 1 - y_1) \\ &\quad - C(1 - x_1, 1 - y_2) + C(1 - x_1, 1 - y_1)\end{aligned}$$

- $C(u, 0) = 0 = C(0, v)$  for any  $(u, v) \in \mathbb{I}^2$ .
- $C(u, 1) = u$  and  $C(1, v) = v$  for any  $(u, v) \in \mathbb{I}^2$ .

## Example

- ▶ We have the following relation

$$\bar{H}(x, y) = \hat{C}(\bar{F}(x), \bar{G}(y)).$$

and

$$\hat{C}(u, v) = u + v - 1 + C(1 - u, 1 - v),$$

- ▶ One can find the survival copula of  $X$  and  $Y$  if
  - The copula  $C_{XY}$  is known.
  - Using Sklar's Theorem when the survival joint distribution function is known.

## Example

▶ (*Gumbel's bivariate exponential distribution*). Let  $H_\theta$  be the joint distribution function of  $X$  and  $Y$  given by

$$H(x, y) = \begin{cases} 1 - e^{-x} - e^{-y} + e^{-(x+y+\theta xy)} & \text{if } x \geq 0, y \geq 0, \\ 0 & \text{otherwise} \end{cases}$$

where  $\theta \in [0, 1]$ . Then the copula  $C_{XY}$  is

$$C_\theta(u, v) = u + v - 1 + (1 - u)(1 - v)e^{-\theta \ln(1-u) \ln(1-v)}$$

hence

$$\hat{C}_\theta(u, v) = uve^{-\theta \ln u \ln v}$$

## Example

- Let  $X$  and  $Y$  be random variables whose joint survival function is given by

$$\bar{H}_\theta(x, y) = \begin{cases} (1 + x + y)^{-\theta} & \text{if } x \geq 0, y \geq 0 \\ (1 + x)^{-\theta} & \text{if } x \geq 0, y < 0 \\ (1 + y)^{-\theta} & \text{if } x < 0, y \geq 0 \\ 1 & \text{if } x < 0, y < 0. \end{cases}$$

and the marginal survival function  $\hat{F}$  and  $\hat{G}$  are

$$\hat{F}(x) = \begin{cases} (1 + x)^{-\theta} & x \geq 0 \\ 1, & x < 0 \end{cases} \quad \text{and} \quad \hat{G}(y) = \begin{cases} (1 + y)^{-\theta} & y \geq 0 \\ 1, & y < 0 \end{cases}$$

From the Corollary of Sklar's theorem, one has

$$\hat{C}(u, v) = (u^{-1/\theta} + v^{-1/\theta} - 1)^{-\theta}$$

## PART 2: Continuity and Singularity.

# Singular copula and Absolutely continuous copula

- ▶ For each copula  $C$  induces a probability measure on  $\mathbb{I}^2$  by the following equation

$$V_C([0, u] \times [0, v]) = C(u, v).$$

- ▶ For any copula  $C$ , let

$$C(u, v) = A_C(u, v) + S_C(u, v)$$

where

$$A_C(u, v) = \int_0^u \int_0^v \frac{\delta^2}{\delta s \delta t} C(s, t) dt ds$$

and

$$S_C(u, v) = C(u, v) - A_C(u, v)$$

# Singular copula and Absolutely continuous copula

- ▶ If  $C \equiv A_C$ , then  $C$  is absolutely continuous and it has a joint density function given by  $\delta^2 C(u, v)/\delta u \delta v$ .
- ▶ If  $\delta^2 C(u, v)/\delta u \delta v = 0$  almost everywhere in  $\mathbb{I}^2$ , then  $C$  is singular.
- ▶ From the relation between copula and its components, one has

$$A_C(1, 1) + S_C(1, 1) = C(1, 1) = 1$$

- ▶ The Fréchet - Hoeffding upper bound  $M(u, v)$  is singular and the product copula is absolutely continuous.

## PART 3: The Inversion Method.

# Sklar's Theorem

- ▶ Let  $H$  be a bivariate function with continuous margins  $F$  and  $G$ . From Sklar's theorem, there exists a copula such that

$$C(u, v) = H(F^{-1}(u), G^{-1}(v))$$

and

$$\hat{C}(u, v) = \bar{H}(\bar{F}^{-1}(u), \bar{G}^{-1}(v))$$

where  $\bar{F}^{-1}(t) = F^{-1}(1 - t)$ .

Problem: Consider a system with two components whose life times are  $X$  and  $Y$  respectively, compute the probabilities that one or both components may fail.

- ▶ It is necessary to find the survival function

$$\bar{H}(x, y) = \mathbb{P}[X > x, Y > y]$$

- ▶ Assume that the "shock" of these components follow the Poisson processes with certain parameters:

- Component 1 fail:  $\lambda_1$
- Component 2 fail:  $\lambda_2$
- Both components fail:  $\lambda_{12}$

# Problem Setting

- ▶ Let  $Z_1, Z_2$  and  $Z_{12}$  be the times of the shocks and they are independent exponential random variables, then

$$X = \min(Z_1, Z_{12}) \quad \text{and} \quad Y = \min(Z_2, Z_{12})$$

- ▶ For all  $x, y \geq 0$ ,

$$\begin{aligned} \bar{H}(x, y) &= \mathbb{P}[Z_1 > x] \mathbb{P}[Z_2 > y] \mathbb{P}[Z_{12} > \max(x, y)] \\ &= \exp\{-\lambda_1 x - \lambda_2 y - \lambda_{12} \max(x, y)\} \end{aligned}$$

- ▶ The marginal distribution functions are

$$\bar{F}(x) = \exp\{-(\lambda_1 + \lambda_{12})x\} \quad \text{and} \quad \bar{G}(y) = \exp\{-(\lambda_2 + \lambda_{12})y\}$$

# Survival copula

- ▶ Since  $\max(x, y) = x + y - \min(x, y)$ , one has

$$\bar{H}(x, y) = \bar{F}(x)\bar{G}(y) \min(\exp\{\lambda_{12}x\}, \exp\{\lambda_{12}y\})$$

- ▶ Denote by

$$\alpha = \lambda_{12}/(\lambda_1 + \lambda_{12}), \quad \beta = \lambda_{12}/(\lambda_2 + \lambda_{12})$$

and

$$u = \bar{F}(x), \quad v = \bar{G}(y)$$

then

$$\hat{C}(u, v) = uv \min(u^{-\alpha}, v^{-\beta}) = \min(u^{1-\alpha}v, uv^{1-\beta})$$

- ▶ Denote by

$$C_{\alpha, \beta}(u, v) := \hat{C}(u, v).$$

- ▶ Note that for any  $\alpha, \beta \in [0, 1]$ ,

$$C_{\alpha, 0} = \prod = C_{0, \beta} \quad \text{and} \quad C_{1, 1} = M$$

- ▶ Recall the copula  $C_{\alpha,\beta}$

$$C_{\alpha,\beta}(u, v) = \begin{cases} u^{1-\alpha}v & u^\alpha \geq v^\beta \\ uv^{1-\beta}, & u^\alpha \leq v^\beta \end{cases}$$

- ▶ For  $u^\alpha \neq v^\beta$ , the absolutely continuous component is

$$A_{\alpha,\beta}(u, v) = C_{\alpha,\beta}(u, v) - \frac{\alpha\beta}{\alpha + \beta - \alpha\beta} [\min(u^\alpha, v^\beta)]^{(\alpha+\beta-\alpha\beta)/(\alpha\beta)}$$

- ▶ The singular component is

$$S_{\alpha,\beta}(u, v) = \int_0^{\min(u^\alpha, v^\beta)} t^{\frac{1}{\alpha} + \frac{1}{\beta} - 2} dt$$

# Singular Component

- ▶ Recall that

$$A_{\alpha,\beta}(1,1) + S_{\alpha,\beta}(1,1) = 1$$

Hence,

$$S_{\alpha,\beta}(1,1) = \frac{\alpha\beta}{\alpha + \beta - \alpha\beta}$$

- ▶ If  $U, V \sim U[0,1]$  with  $C_{UV} = C_{\alpha,\beta}$ , then

$$\mathbb{P}[U^\alpha = V^\beta] = \frac{\alpha\beta}{\alpha + \beta - \alpha\beta}$$

# Singular Component

Figure: Marshall - Olkin copulas,  $(\alpha, \beta) = (1/2, 3/4), (1/3, 1/4)$

# The Circular Uniform Distribution

- ▶ Let  $(X, Y)$  denote the coordinates of the uniformly chosen point on the unit circle. In polar coordinate system, its coordinate is  $(1, \theta)$ , then

$$X = \cos(\theta) \quad \text{and} \quad Y = \sin(\theta)$$

or

$$(X, Y) \in [0, 1]^2$$

- ▶ To find a copula  $C_{XY}$ , one needs to find its joint distribution function  $H(x, y)$  for  $(x, y) \in [0, 1]^2$ .

# Joint Distribution function

- ▶ The joint distribution function

$$H(x, y) = \mathbb{P}[\cos \theta < x, \sin \theta < y]$$

- ▶ Since  $(X, Y)$  is uniformly chosen on the circle, hence the probability of this point belongs to an arc is proportional to the length of the arc.

# Intuition about JDF

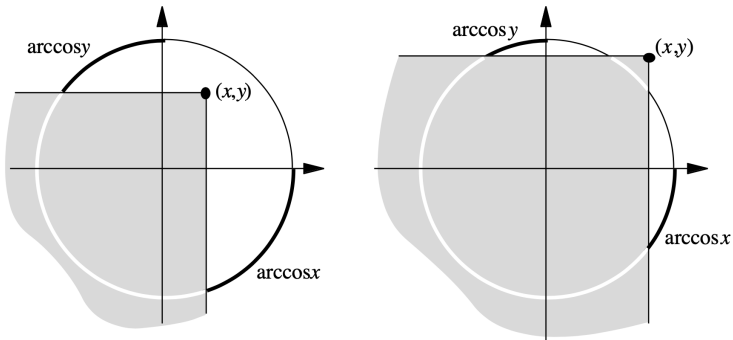

Figure: Joint distribution function

# Joint distribution function

$$H(x, y) = \begin{cases} \frac{3}{4} - \frac{\arccos x + \arccos y}{2\pi}, & x^2 + y^2 \leq 1 \\ 1 - \frac{\arccos x + \arccos y}{\pi}, & x^2 + y^2 > 1; x, y \geq 0 \\ 1 - \frac{\arccos x}{\pi}, & x^2 + y^2 > 1; x < 0, y \geq 0 \\ 1 - \frac{\arccos y}{\pi}, & x^2 + y^2 > 1; y < 0, x \geq 0 \\ 0, & x^2 + y^2 > 1; x, y < 0 \end{cases}$$

- Its marginal distribution functions are

$$F(x) = 1 - \frac{\arccos x}{\pi} \quad \text{and} \quad G(y) = 1 - \frac{\arccos y}{\pi}.$$

- Its quasi functions are

$$F^{-1}(u) = \cos(\pi(u - 1)) \quad \text{and} \quad G^{-1}(v) = \cos(\pi(v - 1))$$

# The copula $C_{XY}$

- ▶ The inverse image of the circle  $x^2 + y^2 = 1$  via transformations  $x = F^{-1}(u), y = G^{-1}(v)$  is

$$|u - 1/2| + |v - 1/2| = 1/2.$$

- ▶ From the marginal distribution functions and the support of the copula  $C_{XY}$ , one has the formula of the copula

$$C(u, v) = \begin{cases} M(u, v), & |u - v| > 1/2 \\ W(u, v), & |u - v + 1| > 1/2 \\ \frac{u+v}{2} - \frac{1}{4}, & \text{otherwise} \end{cases}$$

- ▶ Note that  $\delta^2 C / \delta u \delta v = 0$  almost everywhere in  $\mathbb{I}^2$ , hence  $C_{XY}$  is singular.

# The copula $C_{XY}$

Figure: The copula  $C_{XY}$

## Example

- ▶ Now one has the copula  $C_{XY}$ , how to construct a bivariate distribution function with other margins?
- ▶ Assume that our desired margin is standard Cauchy margin, which means

$$F(x) = \frac{1}{2} + \frac{\arctan x}{\pi} \quad \text{and} \quad G(y) = \frac{1}{2} + \frac{\arctan y}{\pi}$$

- ▶ The procedure to get a bivariate distribution function is
  - 1 Find the quasi functions from the marginal distribution functions
  - 2 Find the image of the circle through these quasi functions
  - 3 Replace the formula of quasi function to the formula of the copula

## PART 4: The Algebraic Method.

## Problem setting

- ▶ Let  $X$  and  $Y$  be continuous random variables with a joint distribution function  $H(x, y)$ .
- ▶ Considering the following quantity

$$\theta = \frac{H(x, y)[1 - F(x) - G(y) + H(x, y)]}{[F(x) - H(x, y)][G(y) - H(x, y)]}$$

where

$$H(x, y) = \mathbb{P}[X \leq x, Y \leq y]$$

$$1 - F(x) - G(y) + H(x, y) = \mathbb{P}[X > x, Y > y]$$

$$F(x) - H(x, y) = \mathbb{P}[X > x, Y \leq y]$$

$$G(y) - H(x, y) = \mathbb{P}[X \leq x, Y > y]$$

Question Which joint distribution function  $H$  that  $\theta$  is a constant?

# Constructing a copula

- ▶ From Sklar's theorem, assume that  $C_{XY}$  is the copula of two random variables  $X$  and  $Y$ , then

$$\theta = \frac{C(u, v)[1 - u - v + C(u, v)]}{[u - C(u, v)][v - C(u, v)]}$$

- ▶ For different values of  $\theta$ , one can find different forms of  $C_\theta$

- ① If  $\theta = 1$ ,

$$C_\theta(u, v) = uv$$

- ② If  $\theta \neq 1$ ,

$$C_\theta(u, v) = \frac{[1 + (\theta - 1)(u + v)]}{2(\theta - 1)} \pm \frac{\sqrt{[1 + (\theta - 1)(u + v)]^2 - 4uv\theta(\theta - 1)}}{2(\theta - 1)}$$

# The signs

- ▶ In case of  $\theta \neq 1$ , one can find 2 different copulas with different signs in this expression.

$$C_{\theta}(u, v) = \frac{[1 + (\theta - 1)(u + v)]}{2(\theta - 1)} - \frac{\sqrt{[1 + (\theta - 1)(u + v)]^2 - 4uv\theta(\theta - 1)}}{2(\theta - 1)}$$

and

$$C_{\theta}(u, v) = \frac{[1 + (\theta - 1)(u + v)]}{2(\theta - 1)} + \frac{\sqrt{[1 + (\theta - 1)(u + v)]^2 - 4uv\theta(\theta - 1)}}{2(\theta - 1)}$$

- ▶ One has

$$C_{\theta}(u, 0) = \frac{[1 + (\theta - 1)u] \pm [1 + (\theta - 1)u]}{2(\theta - 1)}$$

$$C_{\theta}(u, 1) = \frac{[\theta + (\theta - 1)u] \pm [\theta + (\theta - 1)u]}{2(\theta - 1)}$$

- ▶ One can show that  $\delta^2 C(u, v)/\delta u \delta v \geq 0$  and

$$C_{\theta}(u, v) = \int_0^u \int_0^v \frac{\delta^2 C(u, v)}{\delta u \delta v} du dv$$

hence  $C_{\theta}(u, v)$  is an absolutely continuous copula.

## If $\theta \rightarrow 0$ and $\theta \rightarrow 1$

- ▶ When  $\theta = 0$ , then

$$C_0(u, v) = \max(0, u + v - 1)$$

- ▶ When  $\theta = 1$ , then

$$C_1(u, v) = uv$$

These copulas are the Fréchet - Hoeffding bounds for an arbitrary copula.

# Estimate $\theta$ from a data set

- ▶ Recall the definition of  $\theta$

$$\theta = \frac{H(x, y)[1 - F(x) - G(y) + H(x, y)]}{[F(x) - H(x, y)][G(y) - H(x, y)]}$$

- ▶ Our goal is to choose the optimal point  $(x_0, y_0)$  such that

$$\frac{H(x_0, y_0)[1 - F(x_0) - G(y_0) + H(x_0, y_0)]}{[F(x_0) - H(x_0, y_0)][G(y_0) - H(x_0, y_0)]} = \text{constant}$$

The above quantity can be compute with respect to  $(x_0, y_0)$  by analyzing the frequencies of points belonging to quadrant from the point  $(x_0, y_0)$  .

# Estimation

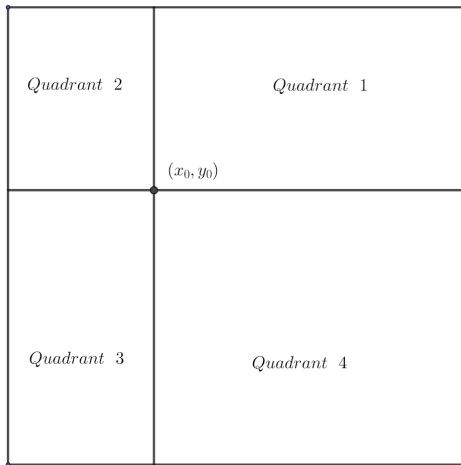

Figure: Quadrants

# Ali-Mikhail-Haq Distributions

- ▶ One is interested in the ratio  $\mathbb{P}[X > x]/\mathbb{P}[X \leq x]$ , where  $X$  is a random variable representing the lifetime of an object.
- ▶ Analogously, one is interested in the ratio  $(1 - H(x, y))/H(x, y)$

## Two typical examples

- ▶ Let  $X, Y$  be two random variables with joint distribution function

$$H(x, y) = (1 + e^{-x} + e^{-y})^{-1}$$

then

$$\frac{1 - H(x, y)}{H(x, y)} = \frac{1 - F(x)}{F(x)} + \frac{1 - G(y)}{G(y)}.$$

- ▶ Let  $X, Y$  be two independent random variables, then

$$\frac{1 - H(x, y)}{H(x, y)} = \frac{1 - F(x)}{F(x)} + \frac{1 - G(y)}{G(y)} + \frac{1 - F(x)}{F(x)} \cdot \frac{1 - G(y)}{G(y)}$$

## Question

Question: Which bivariate function  $H(x, y)$  that satisfies the following equation

$$\frac{1 - H(x, y)}{H(x, y)} = \frac{1 - F(x)}{F(x)} + \frac{1 - G(y)}{G(y)} + (1 - \theta) \frac{1 - F(x)}{F(x)} \cdot \frac{1 - G(y)}{G(y)}$$

where  $\theta \in (0, 1)$ .

► Denote  $C_\theta(u, v)$  by the copula of  $X$  and  $Y$ , then

$$\frac{1 - C(u, v)}{C(u, v)} = \frac{1 - u}{u} + \frac{1 - v}{v} + (1 - \theta) \frac{1 - u}{u} \cdot \frac{1 - v}{v}$$

then

$$C_\theta(u, v) = \frac{uv}{1 - \theta(1 - u)(1 - v)}$$

One can check  $C_\theta$  is a copula and it is absolutely continuous.

# Transformation Method

- ▶ Let  $(X_1, Y_1), (X_2, Y_2), \dots, (X_n, Y_n)$  be IID random variables with common joint distribution function  $H$  and marginal distribution function  $F$  and  $G$ .
- ▶ Denote  $C_{(n)}, H_{(n)}$  by the copula and joint distribution function of  $X_{(n)}$  and  $Y_{(n)}$  where

$$X_{(n)} = \max\{Y_i\}, \quad Y_{(n)} = \max\{Y_i\}$$

- ▶ Denote  $F_{(n)}$  and  $G_{(n)}$  by the margins of  $X_{(n)}$  and  $Y_{(n)}$ . then

$$F_{(n)}(x) = [F(x)]^n, \quad \text{and} \quad G_{(n)}(y) = [G(y)]^n$$

## Find $C_{(n)}$

- ▶ If  $C$  is the copula of  $(X_i, Y_i), i = 1, \dots, n$ , then

$$H_{(n)}(x, y) = H^n(x, y) = C^n \left( [F_{(n)}(x)]^{1/n}, [G_{(n)}(y)]^{1/n} \right)$$

or

$$C_{(n)}(u, v) = C^n(u^{1/n}, v^{1/n})$$

where  $(u, v) \in \mathbb{I}^2$ .

# Image of a copula through a concave function

## Theorem

Let  $\gamma : [0, 1] \rightarrow [0, 1]$  be continuous and strictly increasing with  $\gamma(0) = 0, \gamma(1) = 1$ , and let  $\gamma^{-1}$  denote the inverse of  $\gamma$ . For an arbitrary copula  $C$  any  $(u, v) \in \mathbb{I}^2$ , define the function  $C_\gamma$  by

$$C_\gamma(u, v) = \gamma^{-1}(C(\gamma(u), \gamma(v)))$$

Then  $C_\gamma$  is a copula if and only if  $\gamma$  is concave (or  $\gamma^{-1}$  is convex ).

## $\gamma^{-1}$ is convex $\Rightarrow C_\gamma$ is a copula

- ▶ Since  $\gamma(0) = 0 = \gamma^{-1}(0)$  and  $\gamma(1) = 1 = \gamma^{-1}(1)$ , then for  $(u, v) \in \mathbb{I}^2$ ,

$$C_\gamma(u, 0) = \gamma^{-1}(C(\gamma(u), 0)) = 0 = \gamma^{-1}(C(0, \gamma(v))) = C_\gamma(0, v)$$

$$C_\gamma(u, 1) = \gamma^{-1}(C(\gamma(u), 1)) = u$$

$$C_\gamma(1, v) = \gamma^{-1}(C(1, \gamma(v))) = v$$

- ▶ Let  $K = [u_1, u_2] \times [v_1, v_2]$  be an arbitrary rectangle within in  $\mathbb{I}^2$ , denote by

$$a = C(\gamma(u_1), \gamma(v_1)), b = C(\gamma(u_1), \gamma(v_2)),$$

$$c = C(\gamma(u_2), \gamma(v_1)), d = C(\gamma(u_2), \gamma(v_2))$$

then,

$$\gamma^{-1}(b) - \gamma^{-1}(a) \leq \gamma^{-1}(d) - \gamma^{-1}(c)$$

or

$$V_{C_\gamma}(K) \geq 0$$

## $C_\gamma$ is a copula $\Rightarrow \gamma^{-1}$ is convex

For any  $a, d$  in  $[0, 1]$  such that  $a \leq d$ , let

$$u_1 = v_1 = \gamma^{-1}((a + 1)/2), \quad u_2 = v_2 = \gamma^{-1}((d + 1)/2)$$

Since  $C_\gamma$  is a copula, then the  $C_\gamma$  - measure of the rectangle  $K = [u_1, v_1] \times [u_2, v_2]$  is non-negative. Hence

$$\gamma^{-1}(a) - 2\gamma^{-1}((a + d)/2) + \gamma^{-1}(d) \geq 0$$

which implies  $\gamma^{-1}$  is convex.
