Physikalisches Kolloquium — Physics Colloquium

Einladung — **Invitation**

Monday, 27 June 2022

Lecture Hall O25/H2, 16:15

Biophysics of retinal organoids

Dr. Friedhelm Serwane

Ludwig-Maximilians-Universität München (LMU)
Fakultät für Physik, Lehrstuhl Prof. Rädler

The bottom-up assembly of complex systems often enables researchers to study those at a fundamental level. For the brain or the retina, however, this assembly still is beyond our experimental reach. In recent years, researchers have engineered multi-cellular 3D systems, retinal organoids, which share the same cell types and tissue organization as their *in vivo* counterparts. In the near future, those *in vitro* models provide an opportunity to glimpse at how biology self-assembles neuronal networks and how mechanics guides the formation of their shape, structure and function.
In this seminar, I will present the current and future research of our ERC-funded group. We will explore how tissue mechanics controls retina organoid growth and neuronal function. For this, we build on our expertise in mechanics measurements[1,2] and retina organoid technology[3].
Quantifying the mechanics of neuronal systems might promote a biophysical understanding how neuronal networks are formed and how their function might be tuned via physical cues.
